Red Hat AI

Agentic SDLC

Transforming SDLC with AI on OpenShift

Tom Coufal
Senior Principal Software Engineer

Martin Marosi
Principal Software Engineer

Red Hat

What we'll discuss today

- What Is Agentic SDLC

  Paradigm change from traditional SDLC

- Support system for Agents

  Ecosystem providing context to agents

- Layered Architecture

  Deploying agents on OpenShift with sandbox, isolation and attestation

What Is Agentic SDLC?

SDLC has changed. Code generation is cheap and fast.

Before agents – every stage runs at human speed

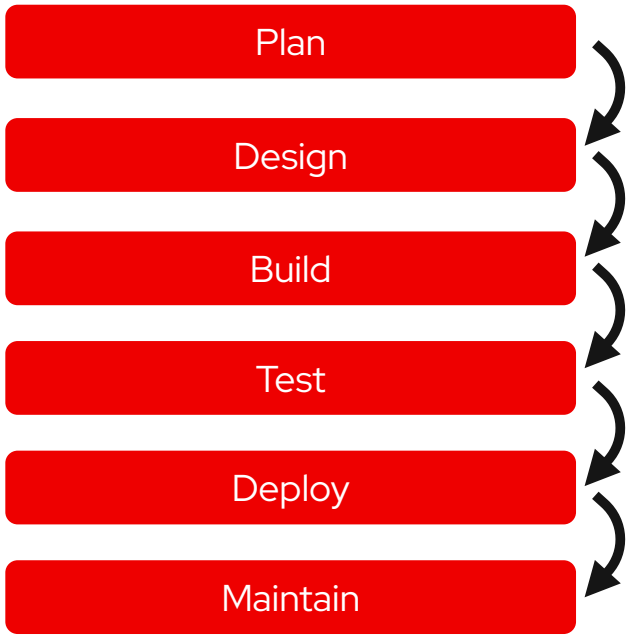

With agents – build runs at agent speed

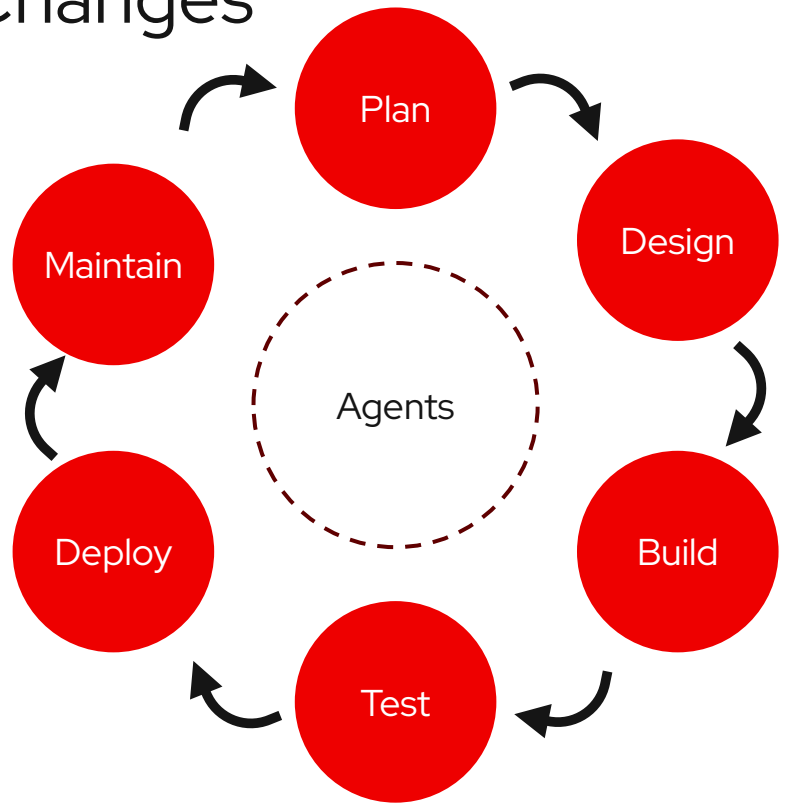

Source:
https://claude.com/blog/the-ai-native-sdlc-playbook

Adapt The Process To Workflow Changes

Traditional - the line - One slow loop back is a new release cycle

AI native - the loop - Hours, human above the loop instigating, directing and governing

Source:
https://claude.com/blog/the-ai-native-sdlc-playbook

Agents Are Involved In Every Step

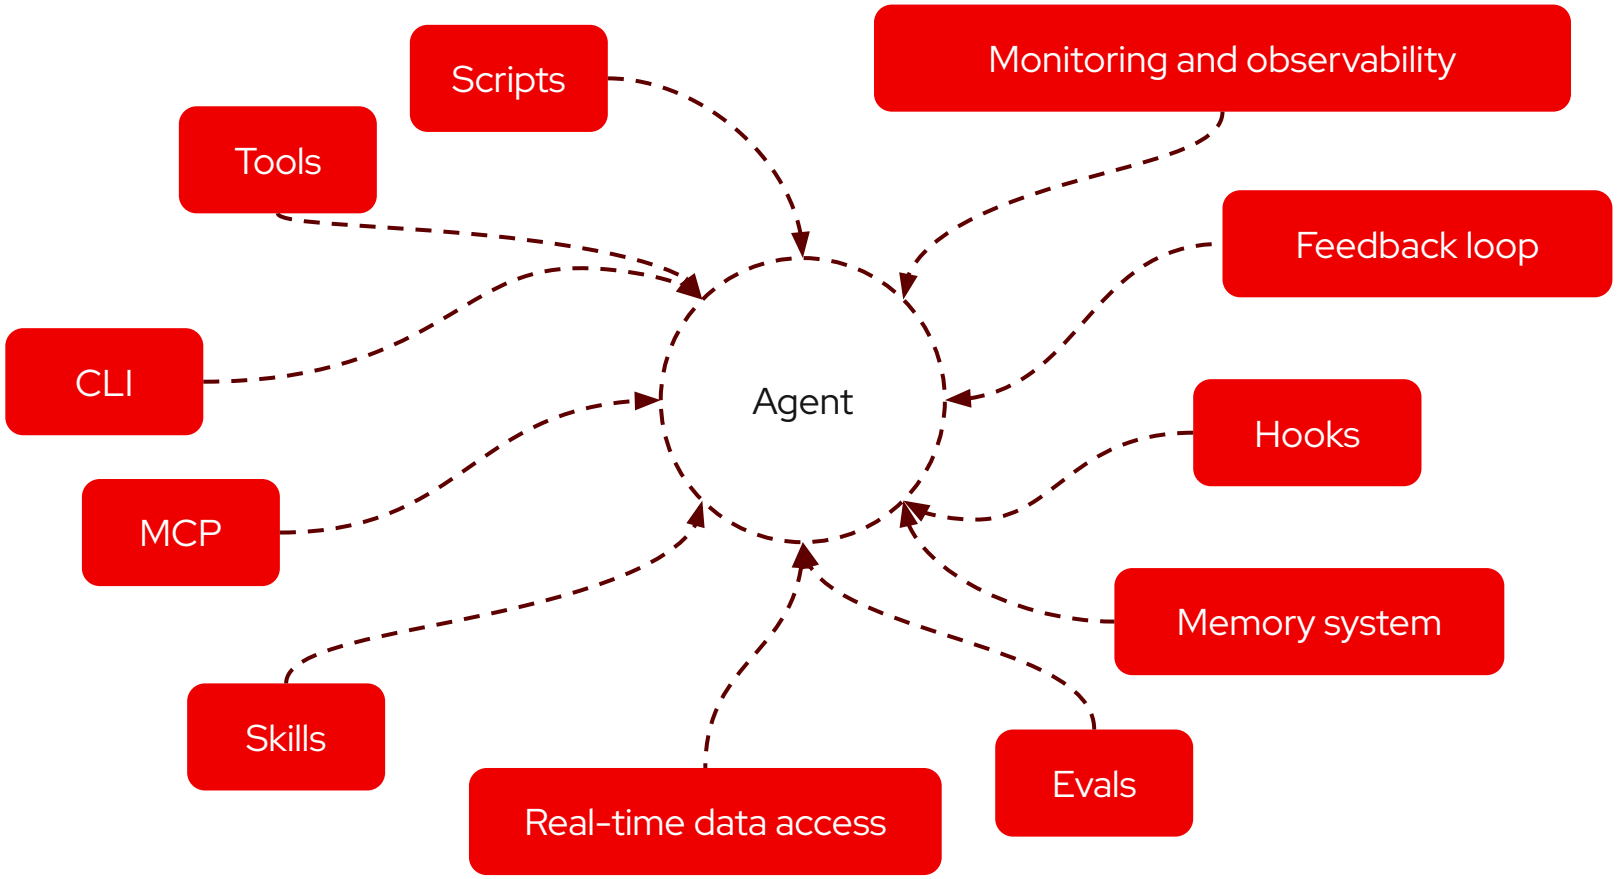

Stage	Traditional SDLC	**Agentic SDLC**
Plan	Requirements gathered by committee, distilled through workshops and sign-offs, written up by hand	Agent synthesizes pain points straight from the sources and captures them within a story which is human readable and machine actionable
Design	Spec written by analysts, parsed by designers	Requirements and design compressed into one working session with an agent, guided by standards encoded as skills, versioned in VCS
Build	Tests and code are handwritten and documentation is written after the main development happens	Tests and code are generated by AI and institutional knowledge is maintained as versioned machine-readable `AGENTS.md` files, skills and long term memory
Test	QA gates at stage boundaries	Continuous evals woven through implementation
Deploy	Humans review every line of code and governance occurs in review cycles, often inconsistently	Layers of agentic review with human review reserved for regulated and critical code. Governance is enforced as the AI acts, with hooks as approval gates
Maintain	Humans watch production for bugs	Agents monitor live deployments. Any breached control band is diagnosed and written back into the loop as a new requirement

https://claude.com/blog/the-ai-native-sdlc-playbook

Support System For Agents

Agents cannot operate in a vacuum; they require a robust ecosystem of tools to succeed.

The Cloud-Native Agent Substrate

Four Pillars of Defense-in-Depth

Blast Radius Containment

Multi-Namespace

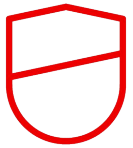

Isolating the control plane, the agent's reasoning engine, and the execution tools into distinct network boundaries to contain compromised workloads.

Workload Runtime Isolation

Run in Sandbox

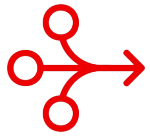

Sandbox governs what agents can do. It instruments the kernel to enforce policy on every file access, system call, and network connection at runtime.

Transparent Security

Auth-proxy Sidecar

A proxy sitting alongside every agent to silently handle cryptographic workload identity (SPIFFE), token exchange, and telemetry—with no burden on the developer.

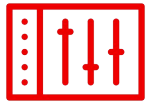

Centralized Tool Governance

MCP Gateway

Federating all enterprise tools behind a single, identity-aware checkpoint that enforces access control before the agent can execute any action.

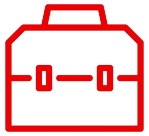

Multi-Namespace Architecture

AI agents are non-deterministic insider threats. We limit their blast radius and establish a secure baseline by strictly isolating components into three distinct boundaries.

Platform Namespace - Root of Trust & Control Plane

Prevents compromised agents from stealing identity keys or tampering with audit trails. Disables cluster API access to stop lateral movement.

Tool Namespace – Capability Execution Env

Enterprise capabilities exposed as MCP servers, federated behind a single MCP Gateway. Enforces a physical boundary between the agent’s reasoning and execution, ensuring authorization is never the AI model's decision.

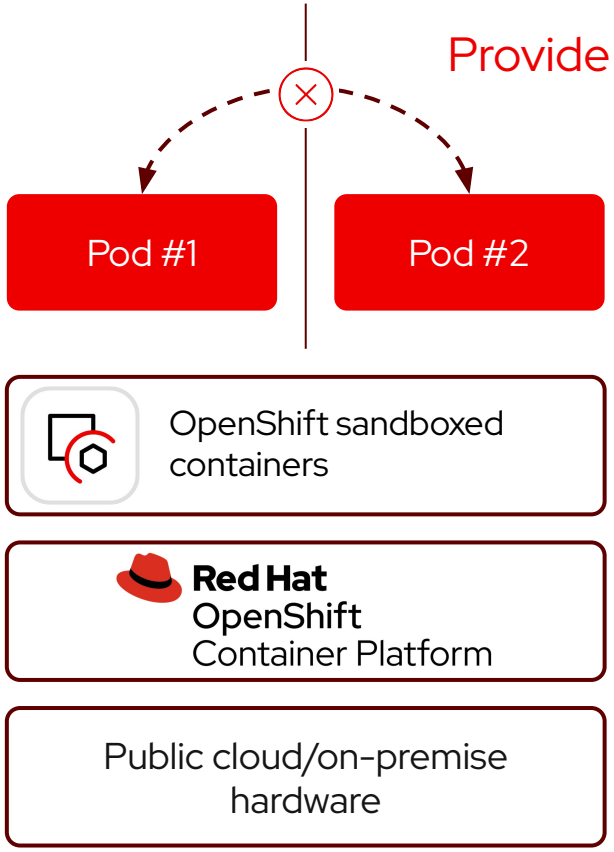

Agent Namespace - Untrusted Reasoning Engine

Agents process untrusted external data, making them the primary attack surface. Strict network segmentation restricts discovery. Misbehaving agents are throttled or revoked surgically.

Architecting Secure Agentic Workflows on Kubernetes: A Financial Sector Case Study
https://events.linuxfoundation.org/kubecon-cloudnativecon-japan/program/schedule/?id=1177775 | https://www.youtube.com/watch?v=lsiiEx3cxbg

Workload Runtime Isolation

Provide secure environments for untrusted AI agent execution

1. Isolation between workloads

2. Isolating the cluster from the workload

Agent Sandbox manages the lifecycle, pre-warming, and stable identity of stateful singleton containers.

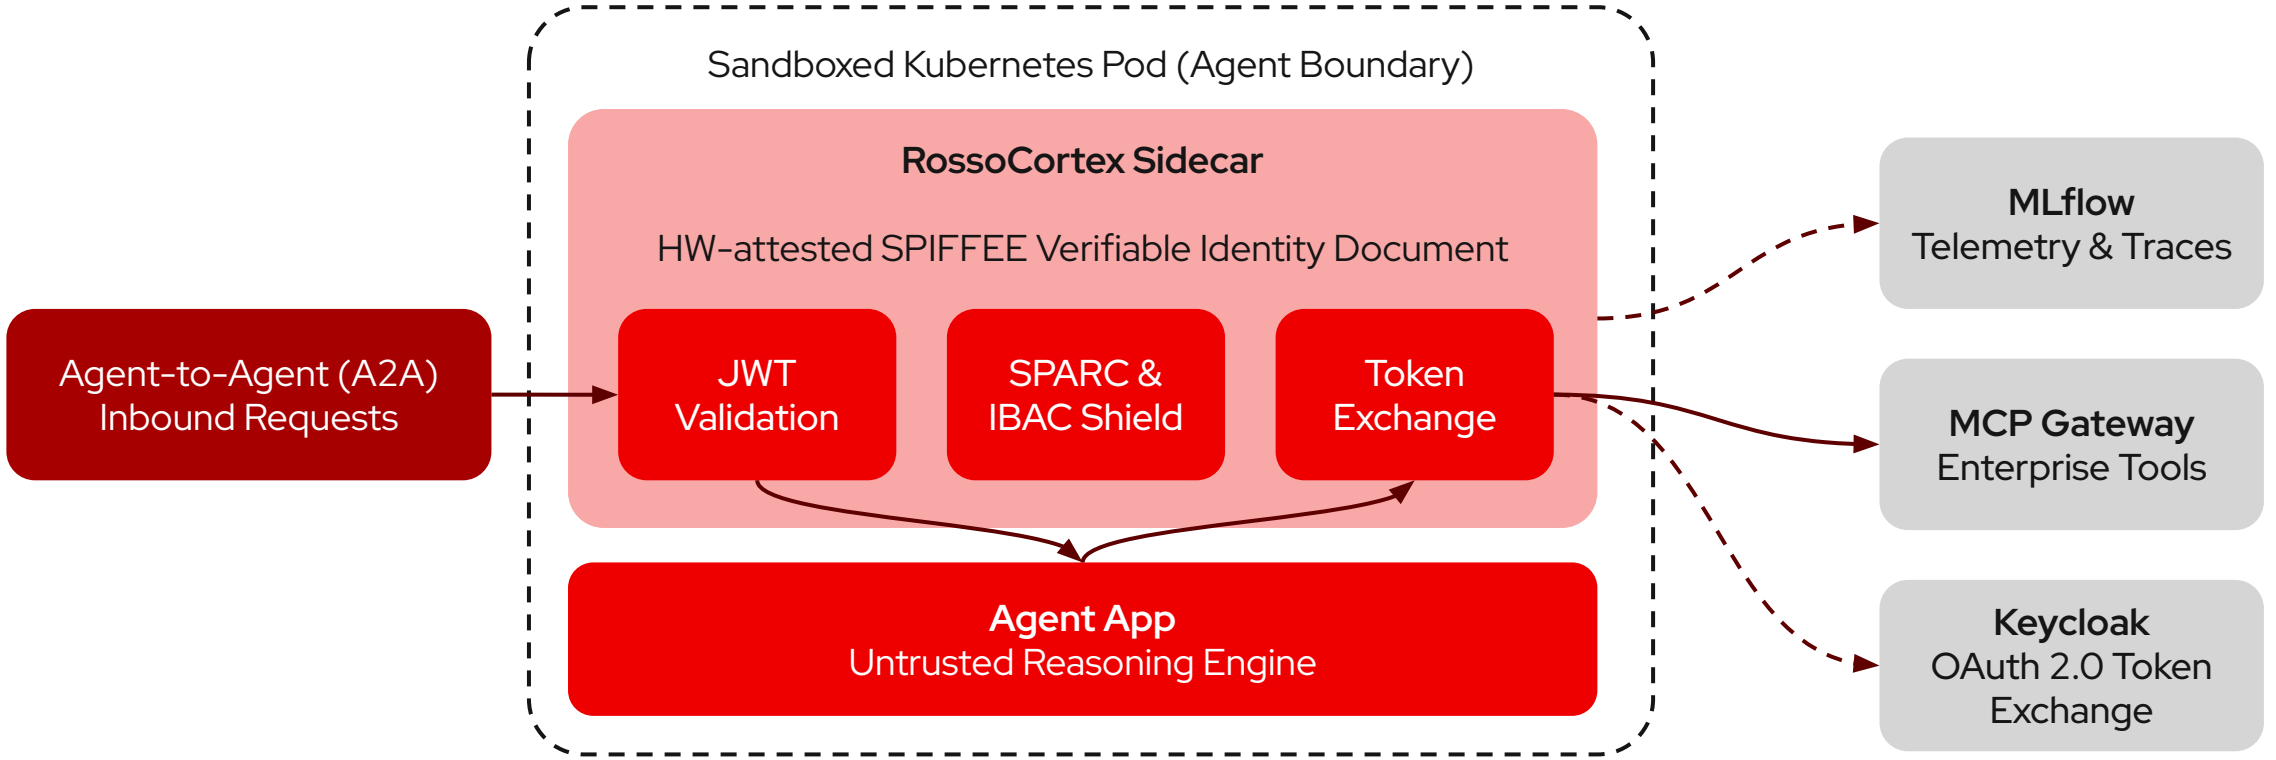

OpenShift sandboxed containers ensures these containers are encapsulated in a lightweight VM/container using the `kata`, `kata-remote` or `openshell` RuntimeClass.

RHOAI 3.5 Developer Preview

Source:
https://developers.redhat.com/articles/2026/07/15/red-hat-build-agent-sandbox-isolated-workload-management-kubernetes

Transparent Security - The Auth Sidecar

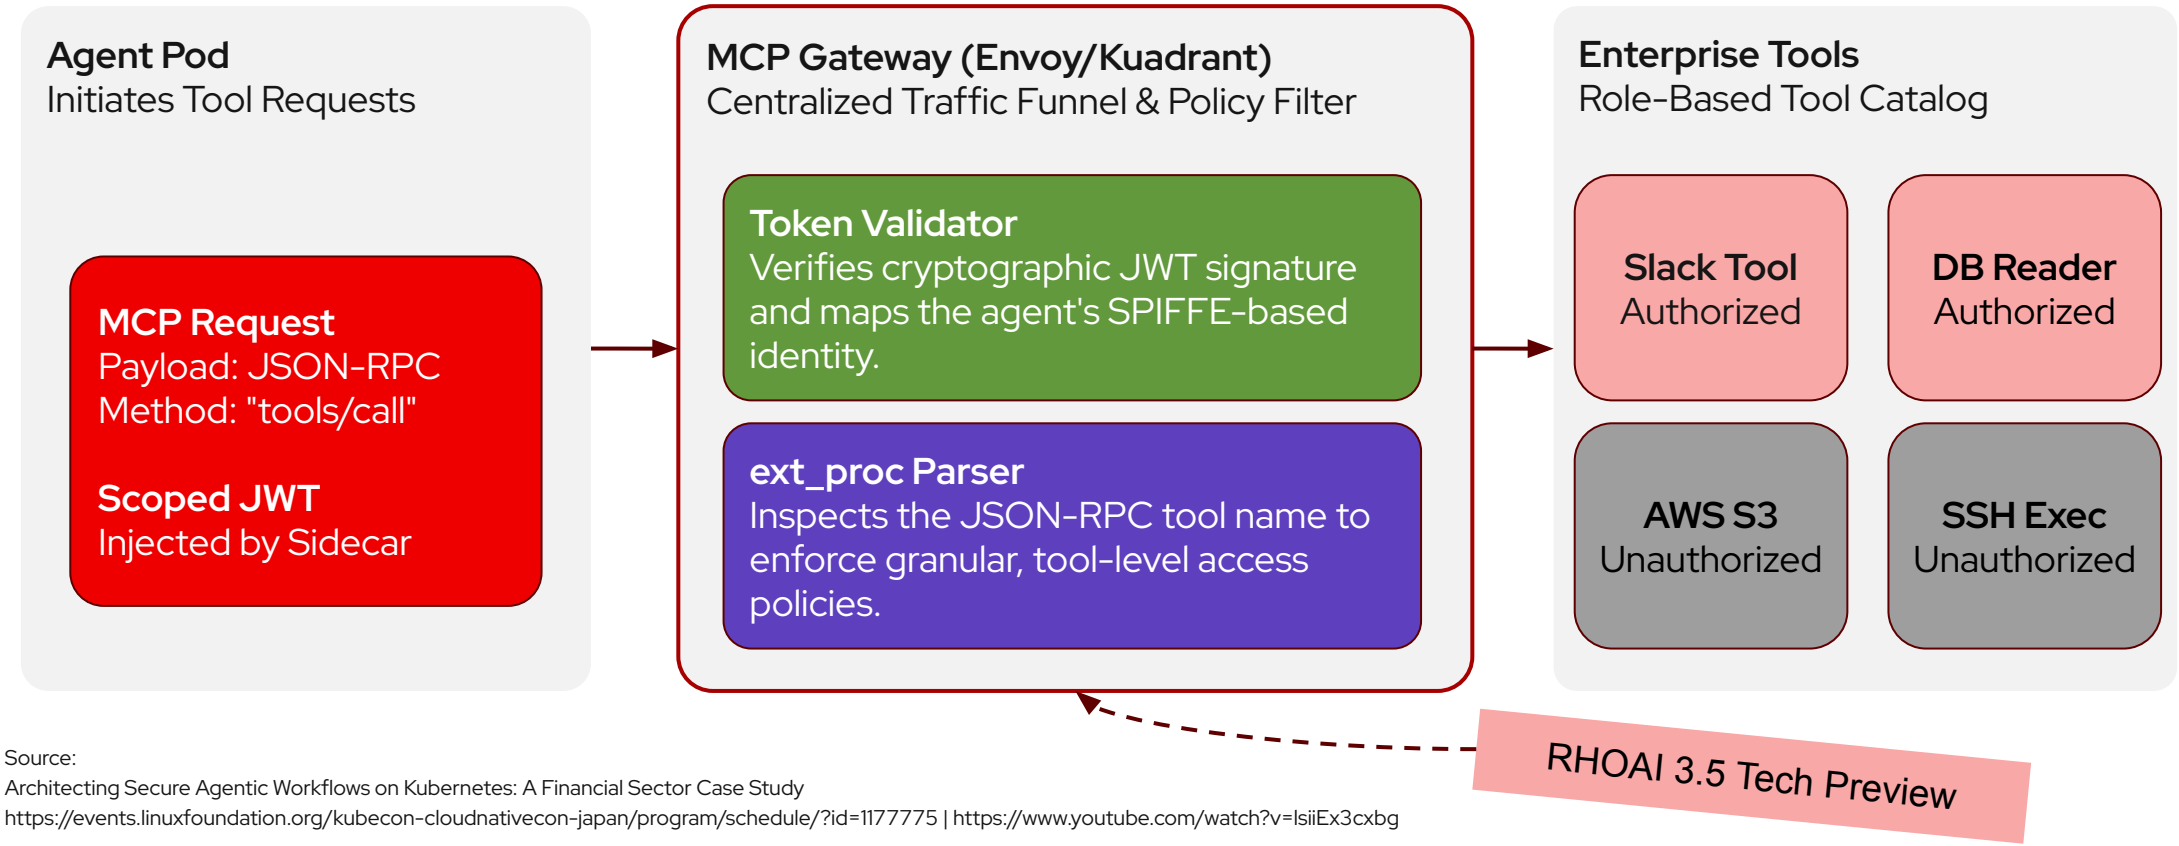

Security, observability, and guardrails are abstracted entirely to the infrastructure layer, protecting and monitoring workloads with zero burden on the AI developer.

https://events.linuxfoundation.org/kubecon-cloudnativecon-japan/program/schedule/?id=1177775 | https://www.youtube.com/watch?v=lsiiEx3cxbg

MCP Gateway: Tool Aggregation & Identity-Based Access

Authorization is never left up to the AI model. Built on the CNCF Kuadrant project, the MCP Gateway acts as an Envoy-based control plane that tightly integrates tool federation with access control.

Managing Agents as Standard Kubernetes Workloads

Transform AI agents into first-class Kubernetes workloads using GitOps-friendly cloud-native principles

What the Developer Writes

Clean & Minimal YAML Logic

```
apiVersion: agent.rosso.io/v1
kind: AgentRuntime
metadata:
 name: my-agent
spec:
 type: agent
 targetRef:
  apiVersion: agents.x-k8s.io/v1alpha1
  kind: Sandbox
  name: my-agent-deployment
```

What the Platform Delivers

Zero-Touch Security, Automated Telemetry & Discovery

Kubernetes Pod

Agent in a Sandbox
Executes developers reasoning logic isolated from kernel and platform.

RossoCortex Sidecar
Proxy intercepts traffic to enforce identity and guardrails.

MLflow Tracing
Zero-code instrumentation exports execution graphs directly.

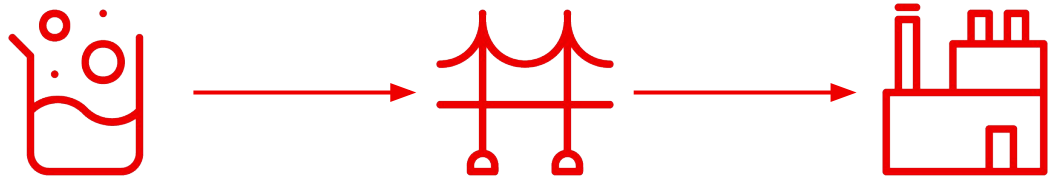

AgentCard Metadata
Publishes real-time capabilities for local system discovery.

Agents on Red Hat AI

Keeping you in production

What is it:
A unified approach for **managing the full lifecycle, security, and performance of AI agents** and their tools

Why it matters:
Provides operational rigor to reliably move agents from experimentation to production with **platform-native lifecycle management.**
