INTER COMPUTER GROUP COMPETENCIES

WHAT IS THE MOST POPULAR HUNGARIAN FOOD?

Stew - pörkölt?

Goulash soup – gulyás leves?

Wiener schnitzel

- Bečki odrezak
- Dunajski zrezek
- Бечка шницла
- Šnitel vienez
- Vídeňský řízek
- Viedenský rezeň
- Виенски шницел
- Bécsi szelet

WHAT IS INFRASTRUCTURE AS A CODE?

```
01 # Infrastructure as Code is a process of managing and provisioning computer
02 # infrastructures and application through machine-readable definition files
03 # instead of using interactive configuration tools or other manual
04
05 resource "IaaS" {
06   attribute1 = "Store infrastructure configuration in script files"
07   attribute2 = "Easy to edit and distribute"
08   attribute3 = "Automatically provision and create new resources"
09 }
10 resource "Configuration" {
11   attribute1 = "Single source of truth"
12 }
13 resource "Cost" {
14   attribute1 = "Saves times and resources"
15   attribute2 = "Fewer configuration mistakes, improving reliability"
16   attribute2 = "Provision the same environment every time"
17 }
18 resource "Git/CVS" {
19   attribute1 = "Use CVS to manage and keep track of infrastructure as code"
20   attribute2 = "Include IaaS in CI/CD pipeline"
21 }
```

WHY USE IAAC?

Store configuration
in script files

Easy to edit and
distribute

Single source of
truth

Automatically provision
and create new resources

Repeatable

WHY USE IAAC?

Use Git/CVS to keep track of the infrastructure changes

Include IaC in the CI/CD pipeline

Fewer configuration mistakes

Saves times and resource

WHO SHOULD NOT USE IAAC?

IT organization with a
very static infrastructure

If you have only one server

WHO SHOULD USE IAAC?

Serious cloud and
kubernetes users

Self service / Dynamic
infrastructure

Works best with
immutable infrastructure

WHAT IS IMMUTABLE INFRASTRUCTURE?

Components are replaced
rather than modified

Requires stateless
application

WHAT IS IMMUTABLE INFRASTRUCTURE?

No patching or in place upgrade

In case of unexpected events, components are redeployed

Lower complexity, easier troubleshooting

No configuration drifts, consistency

BENEFITS OF IMMUTABLE INFRASTRUCTURE

Less application
downtime

Increased security,
reduced attack
surface

Policy enforcement

Seamless scaling

WHAT IS TERRAFORM?

IBM IaaS solution
developed by
Hashicorp

3000+
integrations

Statefile to keep
track of the
configuration

Dependency
mapping

Only creates what
is new or
changed

HOW DOES IT WORK?

CODE

Plan

Apply

Our needs

HOW DOES IT WORK?

CODE

Plan

Apply

Our needs

HOW DOES IT WORK?

Terraform file

- K8S resource
 - Host:
 - Domain:
- VM resource
 - CPU: X
 - Mem: y
 - RHEL 9.1

CODE

Plan

Apply

Our needs

HOW DOES IT WORK?

Terraform file

- K8S resource
 - Host:
 - Domain:
- VM resource
 - CPU: X
 - Mem: y
 - RHEL 9.1

Terraform plan

Day 0:
Create all of them:
+ K8S
+ VM
+ VPC

CODE

Plan

Apply

Our needs

HOW DOES IT WORK?

Terraform file

- K8S resource
 - Host:
 - Domain:
- VM resource
 - CPU: X
 - Mem: y
 - RHEL 9.1

Terraform plan

Day 0:
Create all of them:
+ K8S
+ VM
+ VPC

Integration plugin

Terraform apply

Creates and starts up the resources
Output:

- Logs
- URLs
- Dashboards urls

Our needs

ANSIBLE AND TERRAFORM

ANSIBLE AND TERRAFORM

- Deploy infrastructure with Terraform
- Apply settings and fine tuning with Ansible
- Install software and application with Ansible

- Deploy infrastructure upgrades with Terraform
- Manage everything else with Ansible

WHAT IS IMMUTABLE RHEL?

First step to
modernize your IT

Image mode

Container
technologies

Read only
filesystems for
the binaries

HOW TO COOK YOUR FIRST IMMUTABLE RHEL?

1. Ingredients

2. Edit container
file

3. Steps

HOW TO COOK YOUR FIRST IMMUTABLE RHEL?

1. Ingredients:

- Podman or Podman Desktop
- Access to RH container registry
- Access to a private or public container registry
- A computer to host your immutable VM

2. Edit container file

3. Preparation

HOW TO COOK YOUR FIRST IMMUTABLE RHEL?

1. Ingredients

2. Containerfile:

```
FROM registry.redhat.io/  
rhel10/rhel-bootc:10.0
```

```
ADD local_etc /etc
```

```
RUN dnf install -y httpd  
RUN systemctl enable httpd
```

3. Preparation

HOW TO COOK YOUR FIRST IMMUTABLE RHEL?

1. Ingredients

2. Edit container
file

3. Preparation:

1. Run *podman* to create the container
2. Push the image to the registry
3. Create disk image
4. Move the disk image to the host
5. Fire up the new VM

UPGRADING YOUR FIRST IMMUTABLE RHEL

1. Modify the container file or use a new base image

2. Run *podman* to create a new version of your container

3. Push the image to the registry

4. On the immutable VM run *bootc switch* to download the latest boot image

5. Reboot the immutable VM

THANK YOU!

WHY IMMUTABLE RHEL MATTERS

Operation
optimization

Enhance security

Consistent
deployments

No configuration
drifts
