Cloud Native Apps

Cloud-native applications are a collection of small, independent, and loosely coupled services. They are designed to deliver well-recognized business value, like the ability to rapidly incorporate user feedback for continuous improvement. In short, cloud-native app development is a way to speed up how you build new applications, optimize existing ones, and connect them all.

OpenShift Use Case

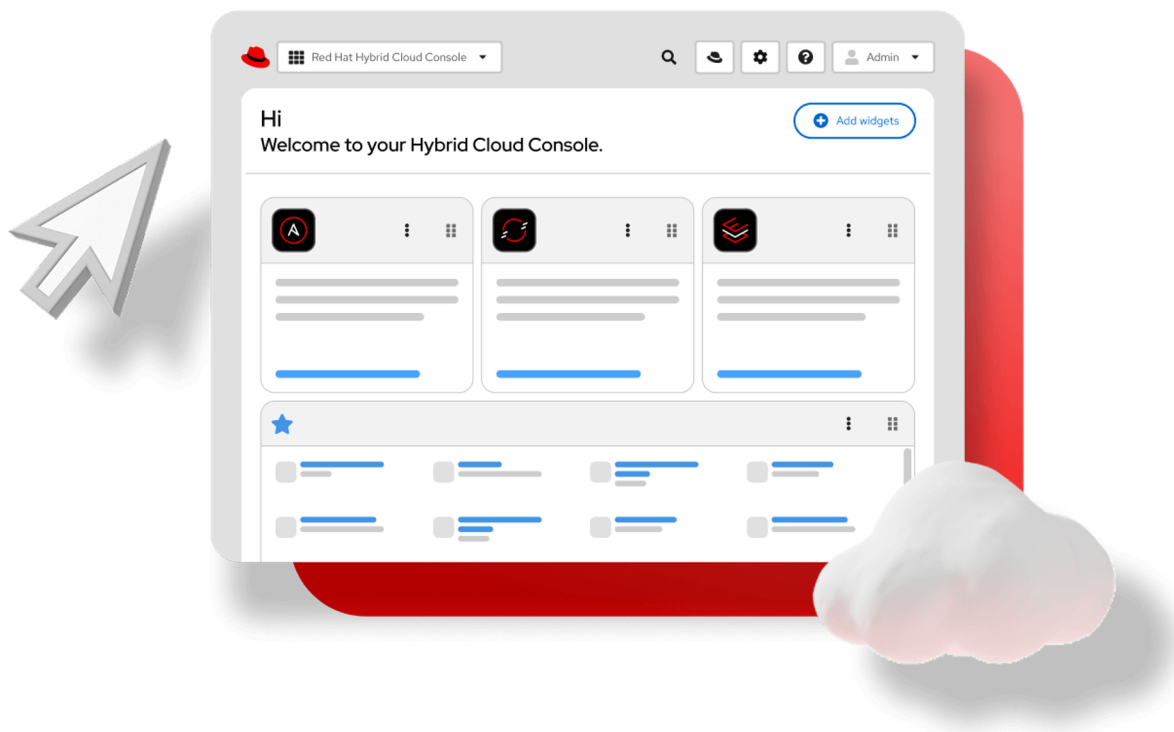

OpenShift: Use case

The project involved the design, installation, and commissioning of a **self-managed Red Hat OpenShift cluster**, deployed on-premises at the customer's site, as a centralized platform for managing development, test, and production environments for the company's **medical applications**.

OpenShift: solution

The cluster installation was carried out through the **Hybrid Cloud Console** using the Assisted Installer, a simplified and interactive web-based method that enabled the deployment of the cluster without the need for dedicated bootstrap nodes, reducing time and complexity during the initial setup phase.

OpenShift: solution

- 3 Master Nodes
- 2 Workers Nodes
- 1 Load Balancer
- Storage per volume RWX

OpenShift

This **fully integrated infrastructure**, aligned with security and compliance best practices in the healthcare sector, provides the customer with a modern and flexible platform for managing and evolving its critical applications.

The adoption of OpenShift, combined with the DevOps paradigm and a microservices architecture, enables efficient application lifecycle management, fostering continuous innovation and operational control.
